AI-Guided Huawei Cloud Scenario

CBR Backup / Restore

AI-guided backup and restore operations using Huawei Cloud CBR and hcloud CLI with approval gates

READY_WITH_WARNINGS · HIGH RISK · hcloud CBR CLI

Scenario Flow at a Glance

The scenario README orchestrates the skill, approval gates, evidence and completion criteria.

1

Discover

resources, vaults, policies

2

Plan

vault, retention, approvals

3

Backup

checkpoint and verify

4

Restore

new resource validation

Primary mechanism
hcloud CBR CLI

Scenario maturity
READY_WITH_WARNINGS
Risk: HIGH RISK

Control model
Discover before create. Verify after every step. No write without explicit approval.

approval

How to Use AI Safely for CBR Backup Restore

1

What AI Does

Plans, analyzes, prepares runbooks, checks dependencies and explains risks. It does not replace expert review.

2

What to Provide

Use anonymized inventories and approved metadata. Never provide real credentials, keys or customer secrets.

3

How to Authorize

Approve each write, cutover, restore, failover or service-impacting action explicitly.

4

When to Stop

Stop on ambiguity, unsupported region/service, unknown state, missing rollback or unclear owner.

AI accelerates planning and evidence collection; it does not remove the need for security review, rollback planning, and human approval.

Your CBR Backup Restore Scenario

Your Starting Point and Goal

AI must understand the business objective, not just execute isolated commands.

Your Starting Point
A Huawei Cloud resource must be protected through CBR with explicit backup, retention and restore validation controls.

Your Goal
Discover or create a vault, associate resources, trigger backup, and optionally restore to a validated new target.

Why AI-Assisted
AI prevents missed prerequisites, quota errors, ambiguous resource IDs and unverified restore assumptions.

Finish
evidence

CBR Backup and Restore Architecture

Result: proceed only after prerequisites, approvals, and verification evidence are present.

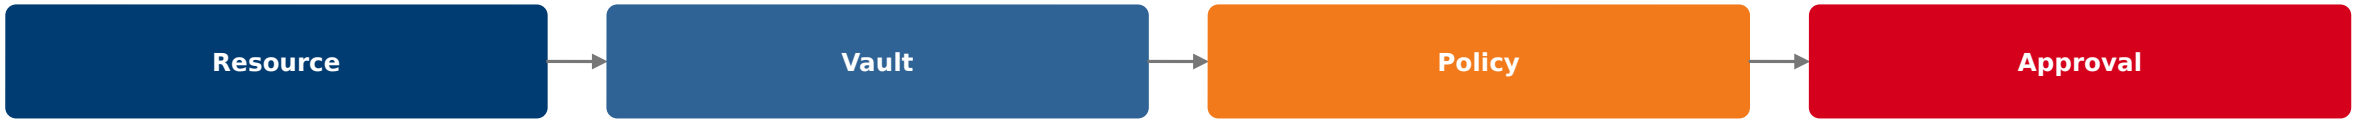

Step 1: Ask AI to Discover and Prove Readiness

Discover Before Create

Example prompt
"Find the protected resource, existing CBR vaults, policies, capacity, associations and cross-region capabilities before creating anything."

AI should know
How to resolve resource names to IDs, validate region, resource state, vault type, capacity and quota.

Verify
Reject zero matches, ambiguous matches, region mismatch, incompatible vault and unsupported resource state.

Stop conditions: missing target, ambiguous resource, unsupported state, missing owner, or unclear rollback.

Step 2: Ask AI to Prepare the Controlled Plan

Plan Vault, Policy and Restore Safety

Inputs

Plan

Approval

Readiness evidence the agent must produce

- ✓ Vault type and region compatible
- ✓ Capacity and quota validated
- ✓ Backup policy reviewed
- ✓ Restore impact plan approved

Plan elements

Vault plan

Resource type, region, capacity, billing, tags and quota impact.

Policy plan

Ad-hoc or scheduled, retention by time/count, enabled state.

Restore plan

Destination, naming, network, impact, rollback and approval.

Every plan must identify approval owner, verification evidence, and rollback or recovery behavior.

Step 3: Ask AI to Execute One Controlled Phase at a Time

Execution: Controlled Two-Phase Process

Phase 1: Backup / Checkpoint

Associate resource to vault
Create or reuse policy
Trigger checkpoint with approval
Verify backup status

Ready

Phase 2: Restore and Validate

Select exact backup
Restore to new target
Validate resource state
Do not delete original

On failure: preserve IDs/logs/evidence → classify root cause → resume only from verified checkpoint.

Step 4: Ask AI to Handle Errors and Edge Cases

CBR Failure Handling

V	**Vault capacity exhausted**	Stop, increase capacity or select a compatible vault.
R	**Resource state incompatible**	Validate supported states before backup; do not force.
B	**Backup failed**	Preserve request ID and logs; investigate quota, region, association.
R	**Restore conflict**	Use a new target name and verify network/IP constraints.
C	**Cross-region unsupported**	Record capability limitation and do not invent replication.

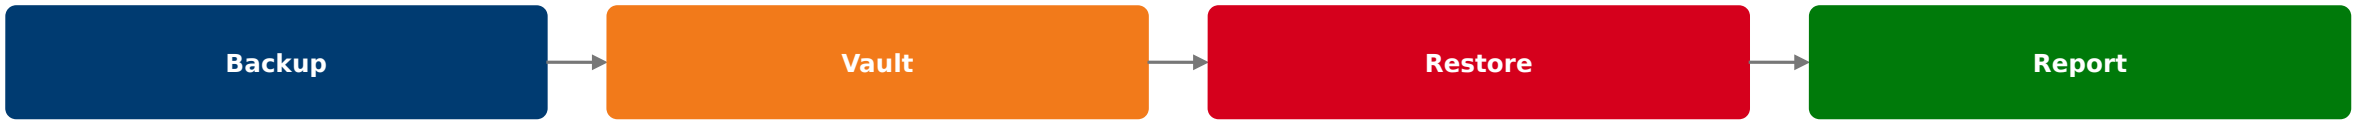

Verify and prevent hallucinations: when AI says “fixed”, require concrete evidence — logs, status, checks, and owner validation.

Step 5: Ask AI to Validate Before Closure

Backup and Restore Must Be Proven

Do not accept generic “looks good”. Require proof before closure.

- ✓ Backup exists and status is acceptable
- ✓ Vault, resource, region and expiration match plan
- ✓ Restore target exists as expected
- ✓ Original resource preserved
- ✓ Validation report and owner decision recorded

Equip Your AI Assistant

What the AI Needs to Execute the Scenario

Start from scenario README; load only the required skill for the current phase.

Scenario README

Scenario README selects backup-only or backup+restore objective and completion criteria.

Operational Skill

Skill uses verified hcloud CBR CLI operations; every write has approval and List/Show verification.

Shared Components

Optional pricing/deploy/ticket help with cost, prerequisites and escalation; no CBR MCP is required.

Rule of thumb: do not load every skill; identify the current phase, load the relevant SKILL.md, execute one controlled step, verify, then return to the scenario README.

Pilot to Production Journey

Recommended CBR Backup/Restore Journey

This scenario is complete only when its objective-specific validation criteria are met and closure is approved.
